from Pinus sylvestris and which has pinosylvin-3-O-methyltransferase (PMT) and antifungal activity. (I) is involved in the methylation of pinosylvin. The products of the invention are useful for providing transgenic plants with part protection from pathogenic organisms. The regulation of the activity of PMT is biologically and economically important as it is involved in the methylation of its involved in the methylation of its biologically and economically

Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dhydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
                                                                                                                                                                                                                                                                                                      AAA53381 standard; DNA; 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 22

Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazoly1)-4-thiazole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 22 BP; 6 A; 5 C; 7 G; 4 T;

                                                                                                                                                              CC impaired airways, including lung disease and diseases whose secondary CC effects afflict the lungs of a subject. They can be used for treating CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, CC impeded respiration, respiratory distress syndrome, pain, cystic CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, CC carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the CC onserved the conversion of the adenosine content of the CC release of decxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA3512 represent the CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 cequences are also called SEQ ID NO:1 to 2815, and then the last 185 cequences are also called SEQ ID NO:1 to 185, but the sequences differ CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to CAAA3392) are specifically claimed ONs from the present invention on N.B. Sequences given in the disclosure of the present invention do not match CC up with their corresponding SEQ ID NO: sequences given in the sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          phosphorothicate; impaired respiration; inflammation; allergy; allergy; disease; bronchoconstriction; inhibitor; antiinflammatory; antiallergic; antiasthmatic; concentration; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asethma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD;
                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a PCR primer used in the preparation of a thermostable mutant luciferase enzyme from Photinus pyralis (firefly). Firefly luciferase catalyses the oxidation of luciferin with the resultant production of light. Luciferases (both wild type and recombinant) lose activity quite rapidly when exposed to temperatures in excess of 30 degrees celsius. The present invention relates to luciferase enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mutant luciferase enzyme comprising specific mutations which increase its thermostability, useful in bioluminescent assays.

                                                                                                                                                                                                                                        This oligonucleotide is specific for the PGK-Neo cassette of pMC5-RKO, a plasmid carrying the mouse melanocortin receptor MC5-R gene (see AAV63708). It was used with a primer (see AAV63704) specific for sequences external to the plasmid to screen AK47 embryonic stem cells following electroporation in the presence of pMC5-RKO. Positive clones were confirmed by Southern analysis. Recombinant targeting vectors were used to produce mice bearing a homozygous disruption of the MC5-R gene locus. Defects on the MC5-RKO mutant mice suggested a direct role for MC5-R in sebaceous glands production. Agonists and antagonists of MC5-R are used to treat disorders of exocrine gland function, e.g. of the lacrimal or sebaceous glands, particularly acne, other skin disorders and 'dry eye', also disorders related to oestrus, mating, gestation and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAV63715
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying compounds that bind to melanocortin receptors - such therapeutic agents for treating exocrine disorders like acne.

                                                                                                                                                                                                                                                                 sequences. The amplified sequences were used to demonstrate the sequences. The amplified sequences were used to demonstrate the cinvention. The specification describes a composition of complexes of polynucleotide molecules covalently coupled to ligand moietles (e.g. biotin) that are specifically bound to ligand-binding molecules (e.g. avidin or neutral avidin (neutravidin)) to form a cross-linked structure. The composition allows incorporation of diverse oligonucleotides or polynucleotides into a single complex for concomitant delivery into the same cell. The composition is used to deliver polynucleotides to viable cells. The method and compositions provide a new way of linking DNA molecules and are useful for gene over-expression and non-covalent cloning. The new system is called biotin-avidin networked gene (BANG) system. It is possible that the BANG system can be used to link multiple gene complexes to elicit broader immune reactions, e.g. as DNA vaccines. The BANG system can also be used as a cloning problems associated with eliminates the reading frame shift and cloning problems associated with
                                                                                                                                              Matches

                                                                                     The invention relates to methods of determining a functional allele profile of a gene in a population. Functional allele profiles comprise the commonly occurring alleles in a population, and the relative frequencies at which such alleles of a given gene occur. The methods are used to identify and determine the frequency of the functional alleles ogenes which display extensive allelic heterogeneity, particularly those implicated in disease or conditions, such as the BRCA1 gene associated with breast cancer, CFTR associated with cystic fibrosis, dystrophin associated with Duchenne muscular dystrophy and Becker muscular described with breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, a well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
dystrophy, and p53 associated with Li-Fraumeni syndrome. The methods also be employed for diseases where allelic and genetic heterogeneity exist, such as breast cancer, neurofibromatosis, and hereditary non-
                                                                                                                                                                                                                                                                                                                                                                                                                              Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Determining

CC Containing a NF-kappaB recognising sequence, at least part of 3'-
CC containing a NF-kappaB recognising sequence, at least part of 3'-
CC untranslated region (3'-UTR) of human-induced nitrogen monoxide synthase
CC (hiNOS) and at least part of 3'-flanking region. Also described are: (a)
CC an expression vector containing the above expression-controlling sequence
C; (b) an expression vector containing (1) 5'-flanking region of hiNOS
CC gene containing a promoter region, (2) a reporter gene and (3) the above
CC expression-controlling sequence in this order from the 5'-side; (c) a
CC cell transformed by the above expression vector; (d) a method for
CC screening a substance controlling activation of NF-kappaB in which a cell
CC which has the above expression-controlling sequence and can detect the
CC activation of NF-kappaB is treated with a sample to observe the change in
CC the expressed amount of the reporter gene; (e) a kit for screening a
CC compound controlling activation of NF-kappaB containing the above cell;
CC (f) a compound controlling activation of NF-kappaB prepared by using the
CC above screening method; and (g) a drug composition for treating diseases
CC caused by activation of NF-kappaB containing, with the above compound as
CC caused by activation of NF-kappaB containing, with the above compound as
CC caused by activation of NF-kappaB containing, with the above compound controlling
CC activation of NF-kappaB easily in a high sensitivity. The present
CC sequence represents a PCR primer used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ន្តដ្ឋឧក្តន្តន្តន<u>ុ</u>ន្ត

Such regulators have an effect on the modification of the expression (in the presence of a cytokine inducer) of a reporter gene in a human cell line transformed with an expression vector containing (in order from 5'-end): the 5'-flanking region of the hiNOS gene containing 54 bases, the reporter gene and the 3'-untranslated region of the hiNOS gene. Suitable reporter genes include chloramphenical acetyltransferase (CAT), beta-galactosidase (beta hiNOS gene are useful for the treatment of inflammation and sepsis, as antitumour agents and for the inhibition of re-angio-stenosis, and other conditions involving abnormalities of hiNOS expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening for regulators of human inducible nitric oxide synthase expression - using human cell line transformed with a reporter gene flanked by 5'-promoter and 3'-non-translated regions of the hiNOS gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 24; 56pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antisense to a conserved gag region of the HIV-1 genome. The anti-
oligonuclectide can be used to treat HIV-1 or HIV-2 infection in
mammal, or inhibit HIV-1 or HIV-2 in a cell. The oligonucleotide
cell toxicity, provokes less immunostimulus than prior art, and i
rich antisense HIV oligonucleotide
The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense oligonucleotide; multiple target; antisense treatm impaired respiration; inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis;

The present sequence is an antisense oligonucleotide specific for endothelial nitric oxide. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-

Such markers be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a PCR primer for single stranded CC conformation polymorphism testing of the BRCA2 cancer susceptibility CC gene. The nucleic acid molecule can be used to construct probes for CC screening cDNA or genomic libraries, sequencing positive clones obtained, and assembling the full length BRCA2 sequence. The BRCA2 nucleic acid comolecules and proteins are useful in a method of medical treatment, CC preferably gene therapy, especially for treating cancer, where the cancer collar melanoma or leukaemia. In particular antisense oligonucleotides capable of hybridising to the BRCA2 nucleic acid, pre-mRNA or mature mRNA are used so that the expression of the BRCA2 nucleic acid is reduced or CC prevented. The nucleic acid molecules are also useful in a method for city susceptibility or predisposition to cancer in a patient. The presence of mutations in a sample of nucleic acid from a patient. The BRCA2 promoter region is useful for screening for CC substances which modulate the expression of nucleic acid under control of CC the promoter. Antibodies are used to determine the presence, amount or CC control of a BRCA2 polypeptide or its mutant forms. The control of or substances which minic the activity of BRCA2 polypeptide, which can be useful to screen for substances which minic the activity of BRCA2 polypeptide, which can be used to descent the presence are useful to screen for substances which minic the activity of BRCA2 polypeptide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

It was used with the Anchor primer in the PCR amplification of human liver 5', RACReady cDNA. The PCR product was used as template in a second PCR with the Anchor primer and nested primer ELA2 (AAT60013) in order to obtain the 5' end of human Elongin cDNA. This was combined with a partial clone obtd. by screening HUVEC CDNA, to provide a cDNA clone (AAT59997) for human Elongin B (AAW13851), a subunit of a novel RNA polymerase transcription
                                                                                                                              PCR primers (AAT61331 and AAT77158-86) were designed for amplification the human Batten disease CLN3 gene (see also AAT61306) exons 1-15. The PCR primers for exon 5 are given in AAT77165 and AAT77166. Novel mutations (see also AAT61332-48) have been discovered in the CLN3 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Batten disease; ceroid lipofuscinosis; CLN3; diagnosis; human; gene therapy; polymerase chain reaction; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Batten disease gene exon 5 PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 22 BP; 1 A; 9 C; 3 G; 9 T; 0 U; 0 Other;

Mutations in the gene induce limb-girdle muscular dystrophy (LGMD) 2 disease. The gene, and fragments of it, can be used in the prevention, treatment, diagnosis and detection of a predisposition to LGMD2 disease. Fifty primers (AA732510-59) were used to specifically amplify the exons and splice junctions of the calpain large subunit 1 gene as well as the regions containing the putative CAT, TATA boxes and the polyadenylation signal. Two primers (AAT32552, AAT32553) were used

                                                                                                                     Retroviral vector pROCH29 was constructed from pUC19 by insertion of two LTRs from Friend virus, a primer binding site, an encapsidation sequence and viral gag sequences. A neomycin resistance gene derived from retrotransposon Th5 was introduced between the two viral LTRs to produce pROCH29-Neo. The amphotropic packaging cell line psi-CRIP was transfected with pROCH29-Neo and the culture supernatant was able to infect NIH 3T3 fibroblasts and produce infectious viral particles, as confirmed by PCR analysis. The PCR primers in AAT31198 and AAT43698 amplified a 900 bp fragment comprising the end of the gag gene and the proximal two-thirds of neoR from the supernatant of NIH 3T3 cell lysate. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                        Cell line for encapsidation of retroviral RNA by transcomplementation also new expression vectors for transcomplementation, useful in gene

The microchip comprises oligonucleotides ADQ26772-seqid:121, which are designed to detect a variety of mutations at mutational hot spots of the beta-catenin gene, fixed on the surface of a solid matrix. beta-catenin, which functions a a downstream transcriptional activator in the Wnt signalling pathway, i a sub-membrane component of the cadherin-mediated cell-cell adhesion system. The beta-catenin microchip of the invention can be used in studies to detect beta-catenin mutations and unravel the signal transduction mechanism and tumourigenesis related to beta-catenin gene, and so is useful in cancer research, for example in elucidation of the Wnt signaling related mechanism. The present sequence is an olicidation of the signal transcription of the categories of the signal of the s
                                                                                             The sequences in AAQ23967 and AAQ23968 are used to amplify the tax gene sequence from human T-cell lymphotrophic virus I (HTLV-I). This family of viruses are linked to certain rare human T-cell malignacies, HTLV-I is linked with a chronic demyelinating disease of the central nervous system (CNS). These primers can also be used to detect possible chronic fatigue immunodysfuction syndrome (CFIDS) - associated virus (CAV) retroviral DNA in CFIDS patients using PCR.                                                                                                                               The retroviral vector pFOCH29-neo was constructed by inserting the neomycin resistance gene from retrotransposon Tn5 between the two LTRs derived from Friend marine leukaemia virus proviral sequences. The ability of the vector to infect NH3T3 cells was analysed by PCR using two primer pairs. The first pair (AAQ81043-4) amplified the 900 bp fragment from the end of the retroviral gag gene and comprising the proximal two thirds of the neomycin resistance gene; the second primer pair (AAQ81045-6) amplified the 610 bp fragment comprising the distal third of the NeoR gene and the proximal half of the LTR. (Updated on 25 MAR-2003 to correct PN field.)

The new feature is that this substance is an aptamer. The device is particularly an implant, e.g. a stent, vascular prosthesis, heart valve, joint etc., but may also be a component of an extracorporeal circulation system, a nanomaterial for tissue englineering and vascular surgery, a catheter, contact lens, storage device for blood etc., also a bioreactor for isolation and culture of selected cell types, for production of substances or for growing organ replacements. The present sequence is an aptamer suitable for use in the device of the invention.
                        Selecting an animal for desired genotypic or potential phenotypic properties such as muscle mass and/or fat deposition, comprises to for a single nucleotide polymorphism in intron 3 of the IGF2 gene

cc island located in intron 3 of an IGF2 gene, and/or binding of a nuclear factor to an IGF2 gene. The nuclear factor is capable of binding to a stretch of nucleotides which in the wild type pig, mouse or human IGF2 gene is part of an evolutionary conserved CpG island, located in intron 3 of the IGF2 gene. The stretch is functionally equivalent to (ADQ80709). CC The nucleic acid modification in ADQ80709 comprises a G to A transition at IGF2 intron3-nt3072. (M1) is useful for selecting an animal with CC properties related to muscle mass, fat deposition, and/or teat number. CC Also claimed is a method (M2) for modulating mRNA transcription of an IGF2 gene by modulating the activity of an evolutionarily conserved CpG island located in intron 3 of an IGF2 gene and/or modulating binding of a CC nuclear factor to an IGF2 gene. Also claimed is a method (M3) for identifying a compound capable of modulating mRNA transcription of an IGF2 gene in a cell or organism. CC (M3) and (M4) are useful for identifying compounds capable of modulating mRNA transcription of an IGF2 gene in a cell or organism. CC (M3) and (M4) are useful for identifying compounds capable of modulating modulating mRNA transcription of an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene in a cell or organism. CC (M3) and (M4) are useful for identifying compounds capable of modulating mRNA transcription of an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene in a cell or organism. CC (M3) and (M4) are useful for identified are potentially useful for transcription of an appropriate deficiencies and diabetes. The present sequence is an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method (M1) for selecting an animal for having desired genotypic or potential phenotypic properties. (M1) comprises testing the animal for the presence of a nucleic acid modification affecting: the activity of an evolutionary conserved CpG

The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (AMHP) WYETH.

The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (AMHP) WYETH.

                                                                                                                                                                                                                    The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human laminin alpha 4 (LAMA4) DNA which is located at chromosomal position 6q21.
                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nucleotide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.

                                                                                                                                                                    This invention relates to a novel method for the rapid identification of CC pathogens occurring in environmental samples or biological samples CC derived from humans and animals. Specifically, it refers to using CC intelligent primers to obtain an amplification product in order that the molecular mass of the amplicon can be determined by mass spectroscopy, CC which in turn identifies the pathogen found in the sample. The present invention describes the rapid detection and identification of an CC instead relies on the use of intelligent primers to target ribosomal RNA CC instead relies on the use of intelligent primers to target ribosomal RNA CC instead relies on the use of intelligent primers to target ribosomal RNA CC instead relies and relies and medical diagnosis which is useful in pharmacogenetic analysis and medical diagnosis (including cancer CC diagnosis based on mutations and polymorphisms), or for detecting single nucleotide polymorphisms in blood typing or stereotyping of viruses. This cligonucleotide sequence is an intelligent PCR primer used to identify invention

The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases,
                                                                                                                                                                                   New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (MALY/)

Providing diabetes, biologically active moiety such as insulin for treating involves administering to mammals immune privileged-cells ically modified to express biologically active moiety.

Example 2; SEQ ID NO 3; 68pp; English.

The invention relates to a method of providing a biologically active moiety by administering cells that are naturally immune privileged and content have been isolated and genetically modified in a laboratory caparatus so as to express biologically modified in a laboratory converse biologically active moiety such that the cells caparatus so as to express biologically active moiety in pharmacologically effective amounts converse biologically active moiety in pharmacologically effective moiety converse biologically active moiety in vivo. The method is useful for treating diseases and conditions requiring protein therapy such as Type I and Type II diabetes (insulin), parkinson's disease (tyrosine hydroxylase), neurodegenerative consultations of the central and sympathetic nervous system (neurotrophins), consemia (crythropoietin), dwarfism (human growth hormone), diabetes consipidus (vasopresin) and haemophilia (Factors VIII and IX). The method is useful for providing hormones, enzymes or drugs to mammals including consense, in need of sustained doses for extended periods. The method is efficient, convenient and cost-effective for site-specific contents of sefficient, convenient and cost-effective for site-specific contents of the present sequence represents a pig beta-actin reverse transcriptase (RI)-PCR primer.

The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obseity, infectious diseases, anorexia, cancer, neurodegenerative disorders, lateliner's diseases, parkinson's disease, immune disorders and hasematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Grosse WM, Smithson G, Larochelle WJ, Shimkets Boldog FL, Edinger SR, Chapoval A;

```

detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention. Sequence 21 BP; A; œ Ç 6 G; 6 T; 0 ς. 0 Other;

It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, linfectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US2004067490-A1

                       The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoletic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                            New isolated polypeptide, useful for treating or preventing associated with the polypeptide, e.g. diabetes, infectious cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                        (RIEG/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obseity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anderson DW, Vernet CAM, Catterton E, Miller CE, Shenoy SG; Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyankar UM, Burgess CE, Gerlach V, Casman SJ, Rieger DK; Grosse WM, Smithson G, Peyman JA, Starling G, Rothenberg ME; Larochelle WJ, Shimkets RA, Crabtree J, Rastelli L, Voss EZ; Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K;

The invention relates to human NOVX polypeptides and polymucleotides. isolated nucleic acids can be used to express the novel proteins, to detect novel mrNA or a genetic lesion in a novel gene and to modulate

New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.

```
detect novel mRNA or a genetic lesion in a novel gene and polynucleotides. The activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.

                                                                                                      The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                      Boldog FL,

The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.

The NI16 nucleic acid molecule and the encoded protein is useful in increasing systemic acquired resistance (SAR) gene expression in a plant. The present sequence is a PCR primer used for cloning Arabidopsis thalianal present.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of inducing or promoting dopaminergic neuronal development by enhancing proliferation, self-renewal, dopaminergic induction, survival, differentiation, and/or maturation in a neural stem, progenitor or precursor cell, or other stem or neural cell by expressing a nuclear receptor of the Nurri subfamily above basal levels within the cell, and treating the cell with a Wnt ligand. The dopaminergic neuron is useful in screening for an agent for use in treatment of a neurodegenerative disease. The neurodegenerative disease includes Parkinson's disease, a Parkinsonian syndrome or neuronal loss. The success of the method of the invention was determined by PCR amplification of selected genes within the induced neuronal cells. This sequence represents a PCR primer used to amplify these genes to detect

                                                                                                                                                                                                                                                                                                                                                                                      comprises a modified ribonucleotide, where the siRNA (SiRNA) which comprises a modified ribonucleotide, where the siRNA is resistant to CC RNase and retains the ability to inhibit viral replication. Also CC described: (1) inactivating a virus in a patient; (2) making a modified CC siRNA that targets a nucleic acid sequence in a virus; (3) a double-cCC stranded RNA molecule of 10-30 nucleotides that inhibits replication of CC hepatitis C virus (HCV); (4) inhibiting replication of HCV; (6) a vector CC comprising a DNA segment encoding the RNA molecule; (7) a host cell CC carrying HCV; (9) treating hepatitis C in a subject; (10) a modified CC siRNA molecule comprising a double-stranded RNA molecule of 10-30 cc nucleotides in length, which mediates RNA interference toward a target CC agent or virus and is linked to at least one receptor-binding ligand; and CC in inducing targeted RNA interference in a patient. The modified siRNA molecules are useful for treating hepatitis C virus, hepatitis D virus, hepatitis C virus, hepatitis A virus, metapheumoniavirus or coronavirus infections. The methods of the invention can be used to correct or compensate for cellular physiological abnormalities involved in conferring susceptibility to viral infections in natients. The present sequence represents an siRNA oligonucleotide, which is used in an example from the present invention.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises conditions a subject, comparing the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the compression level of the marker gene in a biological sample from a healthy condition of the marker gene in a biological sample from a healthy condition in the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are conditionally stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are conditionally stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are conditionally stimulated with interleukin-13; or (b) a group of genes (S2) whose expression for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an animal model for bronchial asthma in a mouse; (5) a method for producing an animal model for bronchial asthma or chronic obstructive pulmonary disease; (3) a marker gene, a ribozyme, a polynucleotide that suppresses the compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene and (7) a DNA chip for testing for corresponding to a portion of corresponding to a portion o

                                                                                                                                                                                                                                                                                                                                                                                                      combinatorial library of compounds that are suspected of inhibiting TRAIL, detecting any interactions that occur and selecting compounds as appropriate. The present invention further describes inducing animals to develop experimental autoimmune encephalitis (EAE) by administration of an EAE-inducing agent followed by a TRAIL inhibitor to induce neuronal cell injury and measuring the response. Accordingly, the method provides a means to identify neuroprotective compounds that can be useful for the manufacture of compositions to treat the chronic inflammatory disease of multiple sclerosis. This oligonucleotide sequence is a PCR primer used to amplify the murine TRAIL-R2 receptor (also known as DR5) of the

                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                      The mutation in (I) is a missense mutation causing an amino acid consubstitution in the extracellular portion of the ERMAP protein, CC specifically causing an amino acid substitution in position 26, 57 and/or CC 60 of the amino acid sequence of ERMAP. The mutation may also be a CC deletion causing a shift in the reading frame of the ERMAP gene, where CC the mutation occurs in nucleotide position 54, 76, 169, 178, 307 and/or CC 108. The mutation is a silent mutation in nucleotide position 54 from C CC to T, or a missense mutation in position 76 from C to T, a G to A in CC position 169, and/or a C to G in position 76 from C to T, a G to A in CC position 169, and/or a C to G in position 178. The mutation may be a CC deletion of nucleotide position 307 and 308 of the ERMAP gene (SEQ ID NO: CC 1). The polynucleotide, oligonucleotide, antibody, apramer or phage is useful for the detection of a Scianna antigen and/or for the CC polynucleotide may also be used in the characterisation of monoclonal and positional antibodies for Scianna antigen determination, and for the caseesment of affinity, avidity, sensitivity, specificity and/or creativity of anti-Sc antibodies. Sequences ADIO3727-ADIO373 represent CC promoter of the human ERMAP gene.
                                                                                                                                                                                                         Query Match

New NOVX treating obesity, and polypeptides and NOVX-associated of ij ptides and nucleic acid molecules useful for preventing essociated disorders, e.g. cancer, diabetes, infection or chromosome mapping, tissue typing or pharmacogenomics. o H

Disclosure; SEQ ij ĕ 1479; 1880pp; English.

neuroprotective, mostropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polynucleotide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome x or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome typing, preventive medicine, and pharmacogenomics. I is used in the exemplification of the invention. polypeptide invention relates to a novel isolated polypeptide (NOVX). A ypeptide of the invention has cytostatic, immunomodulator, roprotective, nootropic, anorectic, antidiabetic, antimicrobial, The mapping, present tissue sequence

                                specification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polypuclestide and antibody are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                               New NOVX
                                                                                                                                                                                polypeptide of the invention has cytostatic, imminomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and antilipaemic activity, and may have a use in gene therapy, and as a vaccine. The polypeptides are encoded by NOVX polynucleotides comprising any of the 303 fully defined nucleotide sequences given in the analyses of the sequences of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zhong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            05-NOV-2002;

IL4 receptor DNA fragment 1111.

```
Coligonuclectides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analysesic, hypotensive, immunosuppressive and cytostatic activity, is a CC beta-adrenergic agonist. The composition is useful for preventing or CC treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The CC pulmonary obstruction, and/or bronchoconstriction and/or lung conflammation, allergies and/or surfaceant hypoproduction are associated conflammation, allergies asthma, impeded respiration, respiratory hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonacleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

                                                                                     The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-2-like or BRCA-2-like or non-BRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or RT-PCR primer used to semi-quantitatively measure gene expression in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proliferation, hematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOV substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. This sequence corresponds to a reverse PCR primer for one of the NOVX genes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 21 BP; 1 A;

                                                                                                                              This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as CGG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CgG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                   Analysis of chemical modification of DNA involves obtaining sample of
to be analyzed, treating DNA with chemical reagents that result in
different base sequences, and determining sequence of resulting DNA.
                                                                                       Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Garner HR,

                                                                                                                                                                                                                                                                                methyltransferase (CCoAOMT2) gene that indicates high digestibility. Also disclosed are four specific mutant CCOAOMT2 sequences that differ from a 264 amino acid (aa) reference sequence as given in ADK69905. The alleles are detected from presence of genetic polymorphisms, especially any of 18 specified, that have, relative to a fully defined 1181 base pair sequence given in the specification as ADK69904. These polymorphisms may be detected by selective hybridisation of probes or by amplification then determining the size of the amplicon. Alternatively, the encoded proteins are detected. The inventive method is especially useful for assessing digestibility of maize, particularly for selection of strains. The nucleic acid that encodes the favourable mutants can be used to prepare transgenic plants that have increased digestibility, and as a primer used in an example from the protein. The current sequence represents a primer used in an example from the protein.

New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obssity, atheroscierosis, cancer, Parkinson's disease, or infections

Disclosure; SEQ ID NO 233; 323pp; English

The invention relates to novel NOVX protein and their encoding DNA's, CC mature forms of the proteins or sequences that are at least 95% identical CC to, or having one or more conservative amino acid substitutions in, the CC proteins. The polypeptides, nucleic acid molecules and antibodies are exceeded in the manufacture of a medicament for treating a syndrome CC associated with a human disease, preferably a NOVX-associated disorder. CC The nucleic acid molecules, polypeptides and antibodies are useful for CC treating, preventing or diagnosing diseases such metabolic disorders, CC diabetes, obssity, infectious diseases (viral, bacterial, fungal, CC helminthic, and protozoal), anorexia, cancer, cardiovascular diseases CC (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's CC disease, Parkinson's disease, epilepsy, immune disorders skin disorders, asthma, and various dyslipidemias. The nucleic acids and polypeptides may CC also be used as targets for the identification of small molecules that CC modulate or inhibit e.g. neurogenesis, cell differentiation, cell

ID ABZ9524
The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5 or 3 end genomic flanking regions, CC 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylattic or therapeutic respiratory effect of an CC entiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or CC lung surfactant in a subject s tissue, or treating bronchoconstriction, lung sulfammation, lung allergies, or a respiratory disease or condition.

CC Note: The sequence data for this patent is mot represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                               This invention relates to a novel library of immunoglobulin (IgG) molecules. Specifically, it refers to prototype IgG molecules that each may comprise a mutation where a single predetermined amino acid has been substituted in one or more positions within one or more of the six complementarity-determining regions (CDRs) of the anti-HIV human GP-120 monoclonal antibody (scFV). The present invention describes a method for generating a library of prototype mutant IgGs (for example IgM, IgA, IgD or a Fab fragment of IgG), which can be used to study protein structure and function via a walk-through mutagenesis procedure. Accordingly, the libraries may be used for the systematic analysis of the binding regions of prototype IgG molecules. Furthermore, it provides specific information regarding particular mutations that alter the interaction of an IgG with its antigen, including multiple interactions by amino acids of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New libraries for a prototype IgG (IgG) comprising mutated IgG or nucleic acids encoding a mutated IgG, useful for generating specific information on particular mutations that alter interaction of an IgG with its

useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample is metaphase to the target genomic nucleic acid is contained in a fixed tissue or a cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   countries you both the sample and control genomic nucleic acid and the array control to both the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the intensities of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus contact a compared with the relative copy numbers of sequences in the case sample as compared with the relative copy numbers of substantially contact as compared with the relative copy numbers of substantially contact as determined using an intercalating dye or a detectable antibody, cor its fragment, that is specific for a nucleic acid/nucleic acid hybrid. Cor its fragment, that is specific for a nucleic acid/nucleic acid hybrid. Cor its fragment, that is specific for a nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic carrays. The genomic array comprises nucleic acid that is prepared from Corporates. The presence array comprises nucleic acid that is prepared from Corporates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

```

The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SI existing in human genes and for the diagnosis of human disease. The

represents a human gene PCR primer of

invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (v-ets erythroblastosis virus E26 oncogene like (avian)) siDNA-RNA hybrid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 21 BP; 5 A; 9 C; 1 G; 2 T; 4 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel double-stranded short interfering nucleic acid (sINA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ERG2 (v-ets erythroblastosis virus E26 oncogene like (avian))
                                                                                                                      New double-stranded short interfering nucleic acid molecule, useful for
                                                                                                                                                                                                                                                                                     11-MAR-2002;
